

Theory of Amorphous Reality

Synopsis

This is a corollary theory to the theory of Amorphous Space. As space has no form outside of singularity space, reality also has no form or structure outside of these singularity structure. The only view of reality that exists is from the singularity viewpoint. And this view of reality is life.

Our Original Concepts

What is meant by reality? What is existence? These are lines in the sand that we have drawn to identify the given, the starting point for our exploration of the universe, the thing that we know to be true, the thing that we should never question. But is it? Suppose we crossed the line and actually examined reality, what would we find and how would our understanding of the universe be altered?

To understand this new theory of reality we need to revisit the concept that it is going to replace. Our original concept had space as a container consisting of three or more dimensions where we could place objects, fields and anything else needed to explain physical reactions. This space is crucial in understanding reality. This is because we used two different concepts in this one word. Space means the vast array of everything in the universe, it is the overall definition of what is. It also means an area to place an individual something, identifying a unique object separate from the other objects in the universe. Then we would connect these two meanings together by the use of measurements, of distances, of times and so forth. And we would call this 'reality' without worrying about event horizons or limitations of information traveling faster than the speed of light. Reality was just the definition of what was, of existence, and the only response to this understanding of reality was in the energy transfers and state changes of ordinary objects which existed within this space.

This view didn't need life, intelligence, or even a view point. It existed all on it's own and everything else was just a simulation or a pretense. Atoms reacting with atoms using the four known forces of the universe creating everything that we see around us. But we really don't exist, we just think we do. Our life awareness is just the electrical pulses and chemical fluids in our brains. Our emotions, our passions, our thoughts are just pretense. Only chemical reactions are real. Life started with the first cell. And this cell became many cells that were organized into individual organisms that could detect and interact with the universe around it. Life has less importance than a rock or dirt. In fact an organism that is alive and one that is dead is viewed as being identical.

This view really goes against what we know in our hearts to be true. We are not a pretense, we know we are real. And the emotions we feel, the drives that we have are real as well. We know that the universe is real and we know we are real as well perhaps to the point we can exist independent to the universe.

Also the probability of an accidental chemical reaction generating a cell has gone to zero as our understanding of cells' complexity has increased. There are other forces at work here than accidental occurrences. In fact the understanding of the forces of life has never been comprehended. It is the purpose of this new view of the reality to promote this understanding. Let me show you something entirely new.

The Theory of Amorphous Space and Reality

The new theory of Amorphous Space describes a universe built by an infinite number of Singularity Spaces that collide and touch the space-time continuum. We could call this continuum our model of reality but it's not a standalone entity. It only exists at the edges of the Singularities; a subspace of these singularity spaces. Instead only the Singularities exist; reality has to be modeled on these

spaces. And the Singularity Space's view of reality is the section of the continuum that it touches.

On this continuum there is a definition of space, the separation distance between two points of space. But there is a counter definition about the joining of two points, the definition of awareness. We have to be aware of the position of two points and the space between them in order to begin to define reality. This awareness is the key to modeling reality in this Amorphous Existence and truthfully without awareness reality wouldn't exist.

To understand awareness we have to start with the meaning of the word is. This word has to do with existence, the structure, make up of the world around us at a particular point in time, at the time of now. In the normal universe, the space-time continuum, this definition of understanding space at the very instant of now breaks the limitation of information traveling faster than the speed of light. The idea of now across space is infinitely fast. The only path where this definition is feasible is from the infinite center of each Singularity Space to their edges, the same path the virtual energy takes. This path is infinitely long from the Singularity standpoint but appears short from the space-time continuum's standpoint. So an infinite speed information gathering is actually not breaking the limitation of going faster than the speed of light as long as awareness is going to the infinite center of the singularity. It is actually going at the speed of light.

So the only place where this awareness can work, the awareness of what is, is in the singularity. And the understanding of what is, is limited to the Singularity shape. But this is all we need as our initial building block. Now understand that a singularity is a paradox, a point is space-less and yet this point contains infinite space. This point also has the time delay that allows the virtual light to travel at the speed of light in our view from the continuum and yet be infinite speed in it's own viewpoint. The definition of space and time seems to come from the singularity, can other attributes be there as well? Truthfully we can not guess what is inside the singularity, we can only see it's affect upon the space-time continuum. But we shouldn't limit our thinking prematurely on the possibilities that could exist.

Model of Life

What is life? It's a view of reality on the micro scale. It's the view from the singularity. It exists along the same path as the virtual energy and like energy can interact with other realities. And as the singularity is smeared across another axis the reality and the energy are also spread into patterns along this axis.

There are two properties of life in it's simplest aspect. Its ability to receive stimulus and it's respond to it. And both of these properties require time. Since our definition of reality is awareness of what is right now, there must be a smearing of reality across time to define life. And smearing only occurs with singularity to singularity interactions. And currently we only know of two types of singularity to singularity interactions, light and matter.

Light's time axis is the direction that light is traveling. So light's life is its awareness of the space that it is traveling through. It is a connection of the points of the universe on the continuum of space-time. And as light transfer energy from one point to another it also delivers life, awareness.

If we take a look at an elementary particle we see that there are actually two realities, the reality from the ring and the reality from the directrix. The reality from the ring is the reality of outside influences. This reality is only existing now since the ring singularity exists on the now point of the time axis, the zero point of the W axis. Note that the time axis is along the space-time continuum in the direction of the W axis. The reality from the directrix, using both spins, is of a three dimensional sphere along the time axis and is an inward reality of the effects of the outside influences.

Is this enough to describe stimulus and responds, the two aspects to life? Probable not since everything we know about life has a structure involving a number of particles interacting as a system or a number of systems interacting upon different types of stimuli and energy transfers.

What creates the structures? And the secondary question of Thermodynamic and entropy. Why in the natural order of things structures are usually eliminated in the “lowest energy – maximum disorder” direction of chemical reactions. Life or the lack of it is across matter, across structures.

To understand how life can exist across matter we need to see how particles combine. Particles have a wavelike nature since they contain energy. They exist across space and can not occupy one unique position. Electrons in an atom exist in electron shells sometimes co-located with an electron of a different spin. The whole shell is its existence. And electrons can be shared between atoms binding atoms together. Reality can go across atoms. But can it go further? Can reality connect with function? Can matter be tied together for purpose?

When particles combine into elements and compounds it's due to the internal forces of nuclear and electromagnetic properties. Along the time axis these particles combine into a single space-time continuum of the combined gravity field. This is what I call pre-knowledge and post-knowledge of the inner singularity of the combined particles. Pre-knowledge because it is awareness of what's happening before the time of now and post-knowledge because it is awareness of what's happening after the time of now. So there is a possibility of anticipation and acknowledgment on a structure of particles.

And the main question is “What is a living body?” A being is made out of multiple beings. And these beings have individual functions, they perform some function necessary for the overall being to exist. How do they know this? And how do these beings work together to make an overall being? If we were to make a simple machine in the physical world say a rope and a bucket in a well, there would be no awareness on the rope's part on how it was helping you. Nor would the bucket care if it was carrying water for you or not. There is no being to the rope or bucket outside of the individual atoms. This state of existence is the very definition of life. It is the reality that it exists, it exists across time and that it senses and reacts with the outside world. And the most profound part is that it is made up of particles, it exists in space.

Now the space that we see around us, the space that we live in, is a subspace. It exists because the interactions of the Singularity Spaces. And we know that the anticipation and acknowledgment of reality exists in the atomic level through Singularity Spaces. In fact it is only at the singularity point where the reality of anticipation and acknowledgment exists. This point is a whole universe to itself and it may be that all singularity points go to this same universe. So the patterns of life, the structure of the body exist within the singularities as well as in the particles. And this would help explain why life always comes from life, the pattern is passed along in the singularity centers as well as the pattern in the material like the DNA.

But is there something else as well? An eye is its own organism with control circuitry with feedback, image processing, repairing, along with the feeding, maintaining of the cells that exist in the eye. There has to be knowledge that is passed around as well as the ability to control cells. Both require energy to be transferred and to be received. And this energy is the life of the being.

So let's assign another attribute to the Singularity Space. As awareness flows into a singularity we are going to define type of awareness flowing out of the singularity which is a “I am” awareness, a body for the particles of matter to occupy. And it doesn't exist at the individual particle level but exists across particles in the anticipation and acknowledgment areas. And as particles combine with particles along the W Axis until the whole world is combined into one gravity field space-time continuum, so are the individual “I am” awareness combined making bodies of bodies. And bodies are part of an environment that is functioning like a living body. This continues until the whole world is covered with life. And we don't know, the world may have its own awareness of life.

Now I call this “The Sterling” effect because I have actually seen it. Sterling was my daughter's cat, a beautiful long hair Siamese. He was an indoor/outdoor cat that was run over by an electrical worker in a truck. And we found him in the street his back legs paralyzed. We took him to the vet who said that his back was broken, leaking fluids and he was dying. So we decided to put him out

of his pain, and as the doctor gave the shot my daughter looked into his eyes and I petted the back of the cat. As he died she saw his eyes go dim and lifeless. I saw something else. I saw the cat diminish and disappear. His body was still there but he wasn't. It disconnected with the atoms and went into another dimension. So there are two bodies here in the physical universe. The body of the particles and the body of life awareness. This is how entropy is turned around. What is this second body? Is it light? Does it use light? Is it connected to the virtual light of the singularities?

One thing that we do know is that life is needed for a body to exist. A body that dies is going into decay. That finely tuned ordering of existence is lost when life is lost. The breathing, blood pumping, energy producing digestion is all stopped. Thinking is stopped. Awareness is stopped. In fact life can not be created in a body. Life can only come from other life, life is continuous. And there are different types of life with the elementary particle being the simplest type of life.

Lets go back to pre-knowledge and post-knowledge of the inner singularity for a living organism. Looking at the details of the organism, the eye knows the details of the eye. The lens of the eye only know the details of the lens. The rods and cones know their details. The processing center of the eyes, the part that came from the brain knows its details. Each part has its understanding from the parts below and it process and provide its understanding to the next level. This understanding is accomplished with energy on the space-time continuum through the various Subspace Singularities that touch this continuum. So the energy is transferred in the physical and the understanding is transferred through the "I am" awareness. And it is my thinking that this awareness designed the body slowly over the eons. Through experimentation and yes through survival changing slowly modifying the lifeforms. Separating out into plants and animals and then again into classes, orders and species. The design exists in the physical body but is modified in the awareness body. And it is also my thought that similar to the smaller size creates greater energy, smaller size creates greater awareness. There is a lot of awareness in a cell, a lot of details, a lot of redesigns, a lot of chemical reactions. For the overall organism not so much, although it is the sum total of all of the life forces within it. And this may have to do with complication as well as size. I do not know everything that my body is doing just the important details. There is a limitation on my awareness. But I can look at the outside world and have a sense of reality. And this reality may be my purpose in being.

Ending Thoughts

Many people want to know if there is life after death? Is there a God? And what is the meaning of life? And of course looking at this scientifically I can't answer these questions. There are no experiments that I can currently generate in the physical universe that can provides these answers. And if you have read my book and other writings you know I believe in God and am a Christian so I don't recommend that you take a wait and see approach to life after death. Instead read my book available for free on the internet "Little Book Open – Securing a Narrow Clear Passage to the Future."
